

## Experimental Minimum Temperature( $T_{min}$ ) Forecast December 2013

Output of the Combined General Circulation Model (CGCM) is used to predict the minimum temperature over the selected stations of Pakistan. The highlight of the December minimum temperature forecast is below normal (1981-2010) minimum temperature ( $T_{min}$ ) in the northern areas of the country. Below than normal temperature will spread over Kashmir as well as along the western borders of the country neighboring Afghanistan. Positive departure from long term average will remain the prominent feature in rest of the country. This departure is highest in the southern parts of Punjab.

In the above figure stations are arranged according to the increasing latitude from left to right.
